Left Rotation 13

A left rotation operation on an array shifts each of the array's elements unit to the left. For example, if left rotations are performed on array [1, 2, 3, 4, 5] , then the array would become [3, 4, 5, 1, 2]. Note that the lowest index item moves to the highest index in a rotation. This is called a circular array.

Given an array of integers and a number, , perform left rotations on the array. Return the updated array to be printed as a single line of space-separated integers.

int a[n]: the array to rotate int d: the number of rotations

Input Format

--The first line contains two space-separated integers n and d, the size of and the number of left rotations. --The second line contains n space-separated integers, each an array a[i].

Constraints

1 <= n <= 10^5 1 <= d <= n 1 <= a[i] <= 10^6

Output Format

-- line contains left rotated array

Sample Input 0

```
5 4
1 2 3 4 5
```

Sample Output 0

```
5 1 2 3 4
```

Explanation 0

When we perform d=4 left rotations, the array undergoes the following sequence of changes: [1, 2, 3, 4 ,5] -> [2, 3, 4, 5, 1] -> [3, 4, 5, 1, 2] -> [4, 5, 1, 2, 3] -> [5, 1, 2, 3, 4]
